Slide 1

Esterel Compilation

The 5-Minute Review Session

- 1. How does the constructive Boolean logic (intuitionistic logic) differ from classical Boolean logic?
- 2. What is the relationship between 1. logical correctness, 2. acyclicity, 3. constructiveness, 4. delay insensitivity?
- 3. In hw synthesis, which Esterel statements introduce registers?
- 4. In the context of Esterel, what is *reincarnation*? What is *schizophrenia*?
- 5. How is schizophrenia dealt with in classical programming languages? Which problems does schizophrenia cause in hw synthesis?

sterel Compilation

The 5-Minute Review Session

- 1. In the context of Esterel, what is reincarnation?
- 2. What is schizophrenia?
- 3. What is a simple solution to the schizophrenia/reincarnation problem?
- 4. What is the approach by Tardieu and de Simone?
- 5. How do these approaches compare?

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Compiling Esterel

- Semantics of the language are formally defined and deterministic
- ► Compiler must ensure that generated executable behaves correctly w.r.t. the semantics
- Challenging for Esterel

The following material is adapted with kind permission from Stephen Edwards

(http://www1.cs.columbia.edu/~sedwards/)

Lecture 9

Slide 5

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation Experimental Comparison

Compilation Challenges

- Concurrency
- Interaction between exceptions and concurrency
- Preemption
- ► Resumption (pause, await, etc.)
- ► Checking causality
- ► Reincarnation (schizophrenia)
 - Loop restriction generally prevents any statement from executing more than once in a cycle
 - ► Complex interaction between concurrency, traps, and loops can make certain statements execute more than once

Automata-based Compilation

- Given Esterel program P and an input event I, the SOS inference rules introduced earlier produce an output event O and a program derivative P'
 - ► From P' and subsequent input event I', can produce another program derivative P'' and further output event O'
 - Can view this as sequence of state transitions—from state P to state P' to state P" etc.
- ► Inference rules guarantee that set of states is finite (Finite State Machine, FSM)
- ► First compiler simulated an Esterel program in every possible state and generated code for each one

Experimental Comparison

Automata-Based Compilation

Note: Strictly speaking, the state of an Esterel program—i.e., what must be remembered from one tick to the next—includes the following:

- 1. The set of program counter values where the program has paused between cycles
- 2. Presence status of signals accessed via pre operator
- 3. Values of valued signals
- 4. Values of variables
- 5. Any state kept in the host language

Only the program counters are reflected in states of FSM

Esterel Compilation

Automata-Based Compilation
Netlist-Based Compilation
Control-Flow Graph-Based Compilation
Experimental Comparison

Automata Example

```
loop
emit A;
await C;
emit B;
pause
end;
```

```
void tick() {
    static int state = 0;
    sigtype A = B = 0;

switch (state) {
    case 0:
        A = 1;
        state = 1;
        break;

case 1:
    if (C) {
        B = 1;
        state = 0;
    }
    break;
}
```

Slide 9

Esterel Compilation

Automata-Based Compilation

Netlist-Based Compilation
Control-Flow Graph-Based Compilation

Automata Example

```
emit A;
emit B;
await C;
emit D;
present E then
emit B
end;
```

 \equiv

```
case 0:
    A = 1;
    B = 1;
    state = 1;
    break;

case 1:
    if (C) {
        D = 1;
        if (E) B = 1;
        state = 2;
    }
    break;

case 2:
}
```

switch (state) {

First State

► A, B, emitted, go to second state

Second state

- ▶ if C is present, emit D, check E & emit B & go on
- otherwise, stay in second state

Third state

► Terminated

Assessment of Automata Compilation

- © Very fast code
- Internal signaling can be compiled away
- © Can generate a lot of code because
 - ► Concurrency can cause exponential state growth
 - n-state machine interacting with another n-state machine can produce n² states
- ► Language provides input constraints for reducing state count
 - "these inputs are mutually exclusive" relation A # B # C
 - "if this input arrives, this one does, too" relation D => E

Automata-Based Compilation

Netlist-Based Compilation Control-Flow Graph-Based Compilation

Automata Compilation

- ► Not practical for large programs
- ► Theoretically interesting, but doesn't work for most programs longer than 1000 lines
- ► All other techniques produce—in general—slower code

Control-Flow Graph-Based Compilation
Experimental Comparison

Netlist-Based Compilation

Second key insight:

► Esterel programs can be translated into Boolean logic circuits Netlist-based compiler:

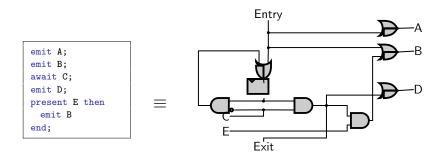

- ▶ Translate each statement into a small number of logic gates
 - ► A straightforward, mechanical process
 - Follows circuit semantics defined earlier
- ▶ Generate code that simulates the netlist

C | A | U Synchronous Languages Lecture 9 Slide 13

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Netlist Example

Assessment of Netlist Compilation

- © Scales very well
 - ▶ Netlist generation roughly linear in program size
 - ► Generated code roughly linear in program size
- © Good framework for analyzing causality
 - ► Semantics of netlists straightforward
 - ► Constructive reasoning equivalent to three-valued simulation
- © Terribly inefficient code
 - Lots of time wasted computing ultimately irrelevant results
 - Can be hundreds of time slower than automata
 - Little use of conditionals

C | A | U Synchronous Languages Lecture 9 Slide 15

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Netlist Compilation

- Currently the only solution for large programs that appear to have causality problems
- ► Scalability attractive for industrial users

Netlist-Based Compilation
Control-Flow Graph-Based Compilation
Experimental Comparison

Control-Flow Graph-Based

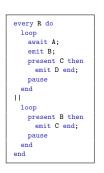

- ► Third key insight:
 - Esterel looks like a imperative language, so treat it as such
- ► Esterel has a fairly natural translation into a concurrent control-flow graph
- ► Trick is simulating the concurrency
- ► Concurrent instructions in most Esterel programs can be scheduled statically
- Use this schedule to build code with explicit context switches in it

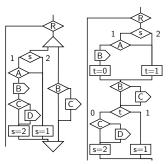

C | A | U Synchronous Languages Lecture 9 Slide 17

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

The CFG Approach

```
if ((s0 & 3) == 1) {
   if (S) {
      s3 = 1;
      s2 = 1;
      s1 = 1;
   } else
   if (s1 >> 1)
      s1 = 3;
   else {
      if ((s3 & 3) == 1) {
        s3 = 2; t3 = L1;
      } else {
        t3 = L2;
    }
}
```

Step 1: Build Concurrent CFG

```
→every R do
loop
await A;
emit B;
present C then
emit D end;
pause
end
||
loop
present B then
emit C end;
pause
end
→end
```

C | A | U Synchronous Languages Lecture 9 Slide 19

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Add Threads

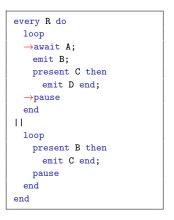

```
every R do
loop
await A;
emit B;
present C then
emit D end;
pause
end
→||
loop
present B then
emit C end;
pause
end
end
```

Split at Pauses

C | A | U Synchronous Languages Lecture 9 Slide 21

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Add Code Between Pauses

```
every R do

loop

await A;

emit B;

present C then

emit D end;

pause

end

loop

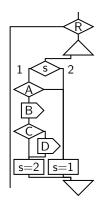

present B then

emit C end;

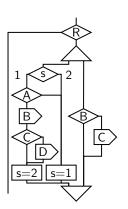

pause

end

end
```

Build Right Thread

Esterel Compilation

Automata-Based Compilation Netlist-Based Compilation Control-Flow Graph-Based Compilation

Step 2: Schedule

```
every R do
loop
await A;
emit B;
present C then
emit D end;
pause
end
| |
loop
present B then
emit C end;
pause
end
end
```

Experimental Comparison

Step 3: Sequentialize

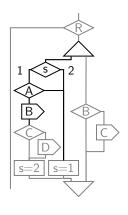

- ► Hardest part: Removing concurrency
- ► Simulate the Concurrent CFG
- ► Main Loop:
 - For each node in scheduled order,
 - ▶ Insert context switch if from different thread
 - ► Copy node & connect predecessors

Experimental Comparison

Assessment of Control-flow Approach

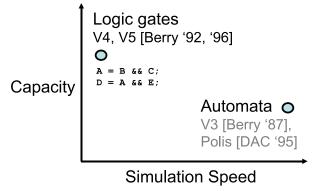

- © Scales as well as the netlist compiler, but produces much faster code, almost as fast as automata
- © Not an easy framework for checking causality
- © Static scheduling requirement more restrictive than netlist compiler
 - ▶ This compiler rejects some programs that others accept
- ► Extension: Pre-process constructive Esterel programs with cycles into equivalent non-cyclic programs [Lukoschus/von Hanxleden 2007]
 - ► Extends applicability of compilation approaches such as the CFG-based approach

Summary

Esterel compilation techniques:

- Automata
 - ► Fast code
 - Doesn't scale
- Netlists
 - Scales well
 - ► Slow code
 - ► Good for causality
- ► Control-flow
 - Scales well
 - ► Fast code
 - ▶ Bad at causality
